

Data Review Questions

General

What do we know from looking at this data?

Do we know which students are learning and not learning?

What patterns can we observe?

What concerns are raised by a review of the data?

What other data sources would clarify and inform our teaching practice?

How do the programs we have in place connect with the concerns identified?

What can we do about what the data reveal?

Specific

How well, overall, are our students doing on each benchmark?

Do all of the items on each benchmark have a high percentage of correct answers?

If not, which items under each benchmark have a high percentage of incorrect answers?

On the incorrect test items, is there an incorrect answer that was picked by a high percentage of students?

What kind of mistake is represented by this choice?

What items do we need to disaggregate to find out if there is a pattern of students not doing well (boys/girls, free lunch, ESL, LD, etc.)?
